

## **Research regarding ground pollution measure efficiency**

### **[ Point ]**

This research aimed the establishment of selecting method and assessment method of ground environment pollution measure in construction sites. Concretely, we examine ground pollution effect prediction method, which is useful to select measures, and monitoring method, which secures the effect after the measures. The results are the follows. We proposed a realistic effect prediction method, which makes possible to select measures according to harmful substances' behavior in the soil. We proposed effective monitoring method, which makes possible to secure effect of measures.
