

# Water (TG1)-Agriculture (TG5)-Droughts (TG6) Joint Session

1. Inputs from each Co-chair:
  - 1) Brief introduction to each TG
  - 2) Advantages and issues to be shared
  - 3) Expected cooperation:
2. Discussion towards coordination and integration:
  - 1) Mapping the advantages and issues
  - 2) Implementation design for cooperation

# International Flood Initiative

<http://www.ifi-home.info/>

The International Flood Initiative (IFI) is a joint initiative in collaboration with such international organizations as UNESCO-IHP, WMO, UNDRR, UNU, ICLR, IAHS, and IAHR. The IFI secretariat is located in the International Centre for Water Hazard and Risk Management (ICHARM) in Japan.

## IFI Partners

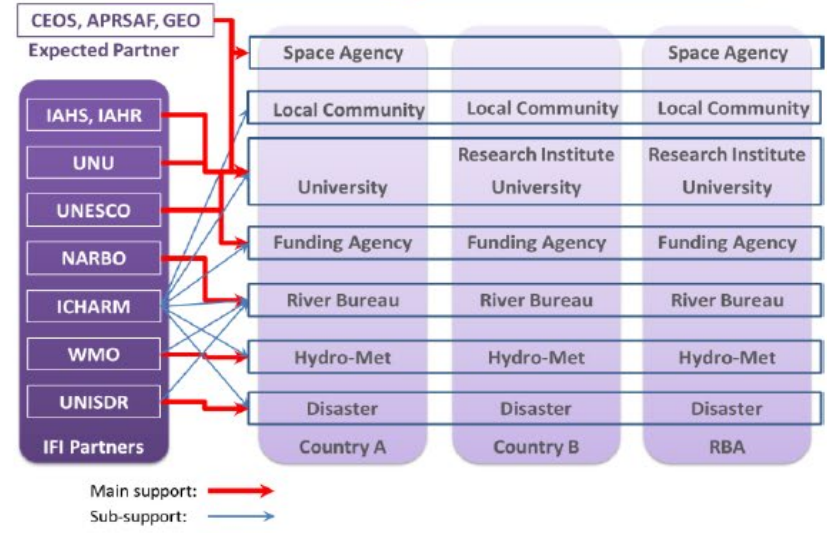

Contributions

## Concept of Platform on Water Resilience and Disasters

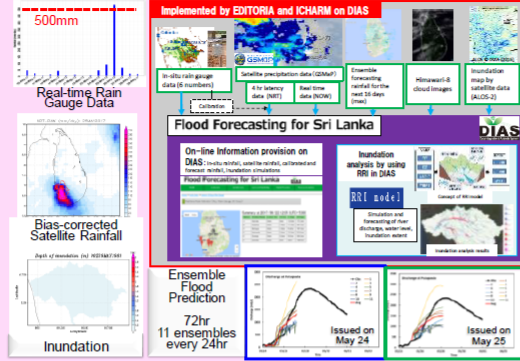

## National and Regional Coordination

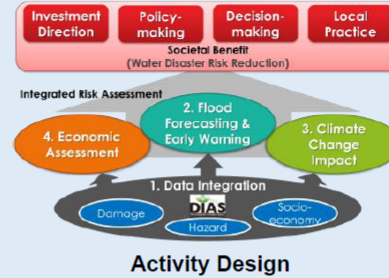

# Sri Lanka

Training on CC and RRI model (August 2019)

# Philippines

Dynamic Flood Early Warning System

Plenary Meeting (February 2019)

# Myanmar

DIAS training participants (February 2019)

Institutional structure of Platform

**Objective:** To identify current and future disaster risks for preparation (e.g., early warning) and mitigation (e.g., contingency planning).

**Target basins:** Sittaung River and Bago River

# Pakistan

"Strategic strengthening of Flood Warning and Management Capacity of Pakistan" ICHARM contributed to the three components of the project

1. Development of a flood forecasting system covering a large part of the Indus River basin

2. Floodplain and Hazard Mapping of lower Indus

3. Capacity building for Pakistan

# Indonesia

**Core group:**

- Ministry of Public Works and Housing,
- Ministry of Environment and Forestry,
- National Agency for Disaster Countermeasure,
- Agency for Meteorology, Climatology and Geophysics

**Pilot river basin:** Bengawan Solo river

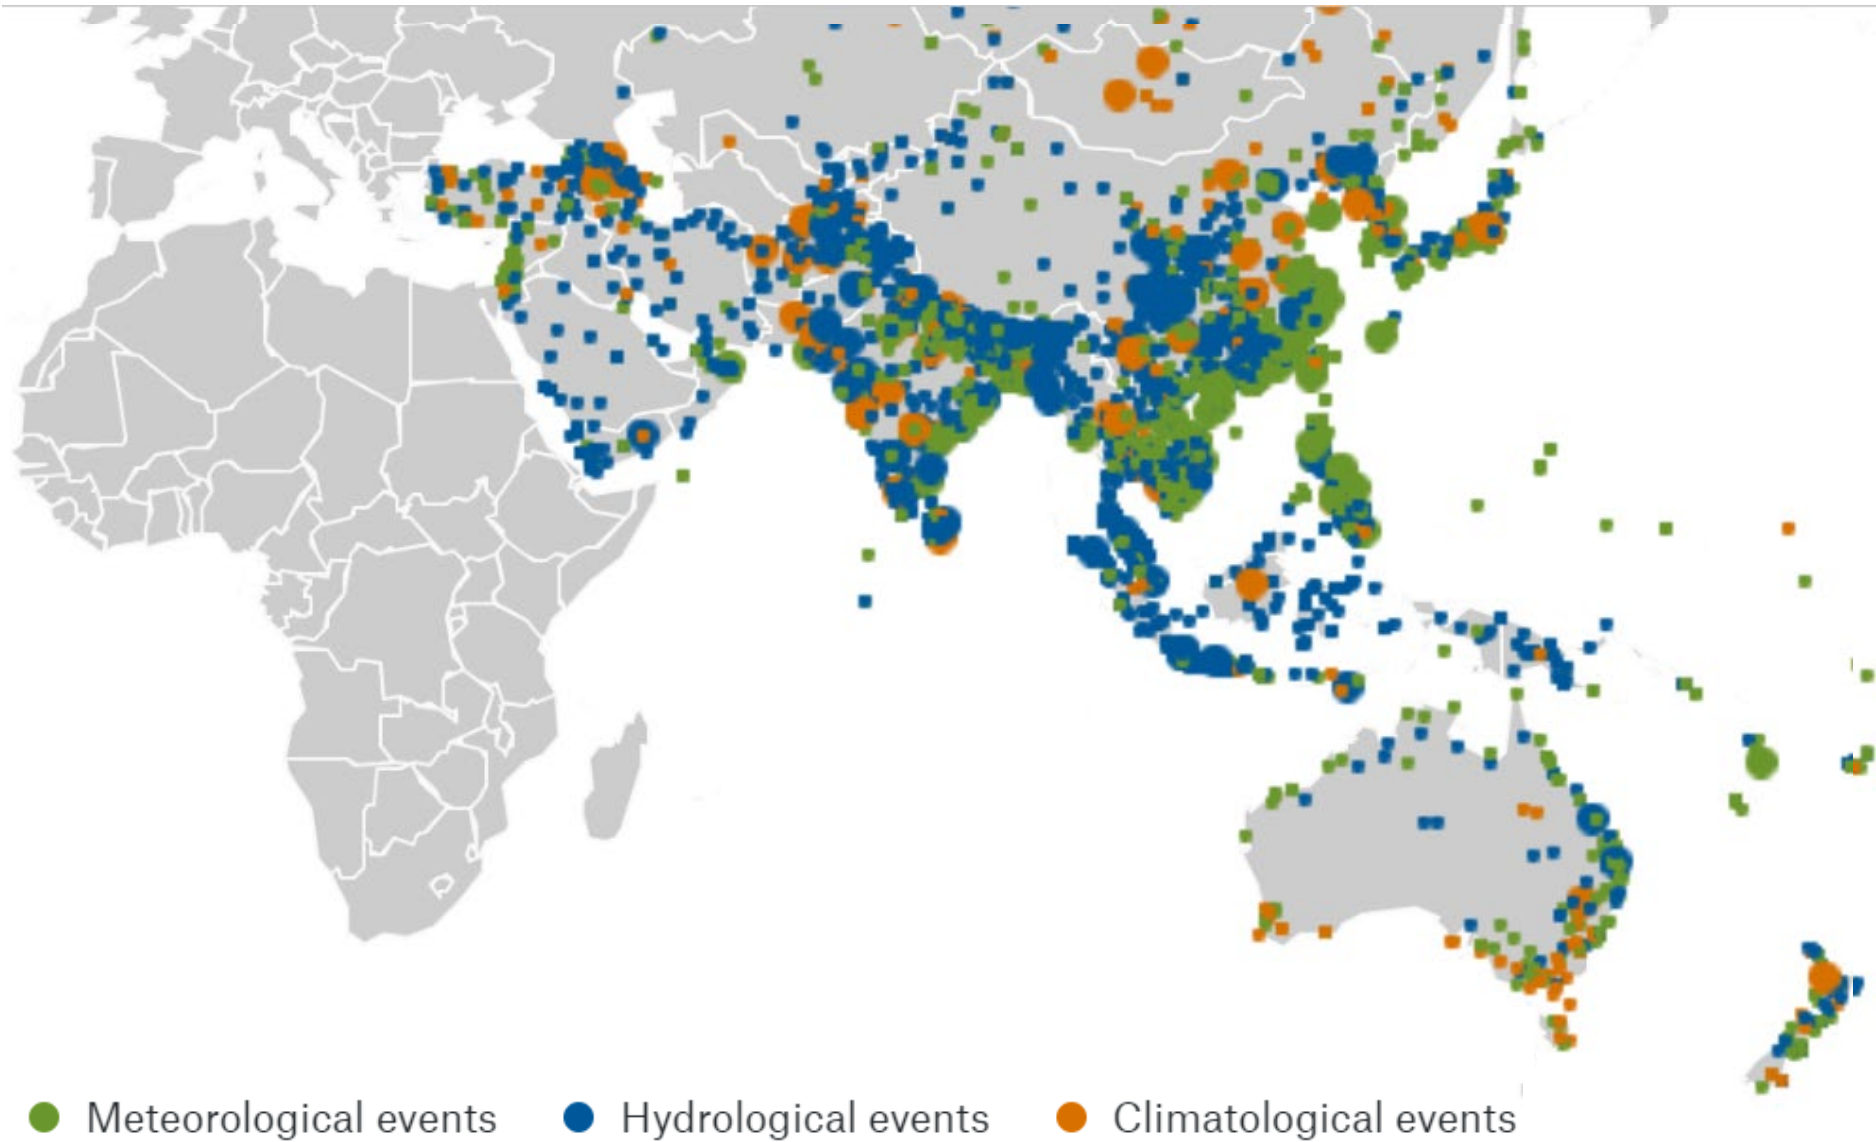

Platform Meeting (August 2019)

Inundation simulation

# 2000-2015

# 2000-2015

Percentage distribution for relevant weather-related loss events in Asia and Australia/Oceania 2000 - 2015

Number of events:  
**3,586**

● 35.2 % Overall  
● 55.3 % losses:  
● 9.5 % **US\$ 627 bn**

● 36.2 %  
● 47 %  
● 16.8 %

Fatalities:  
**267,376**

● 65.9 % Insured  
● 27.4 % losses:  
● 6.7 % **US\$ 77bn**

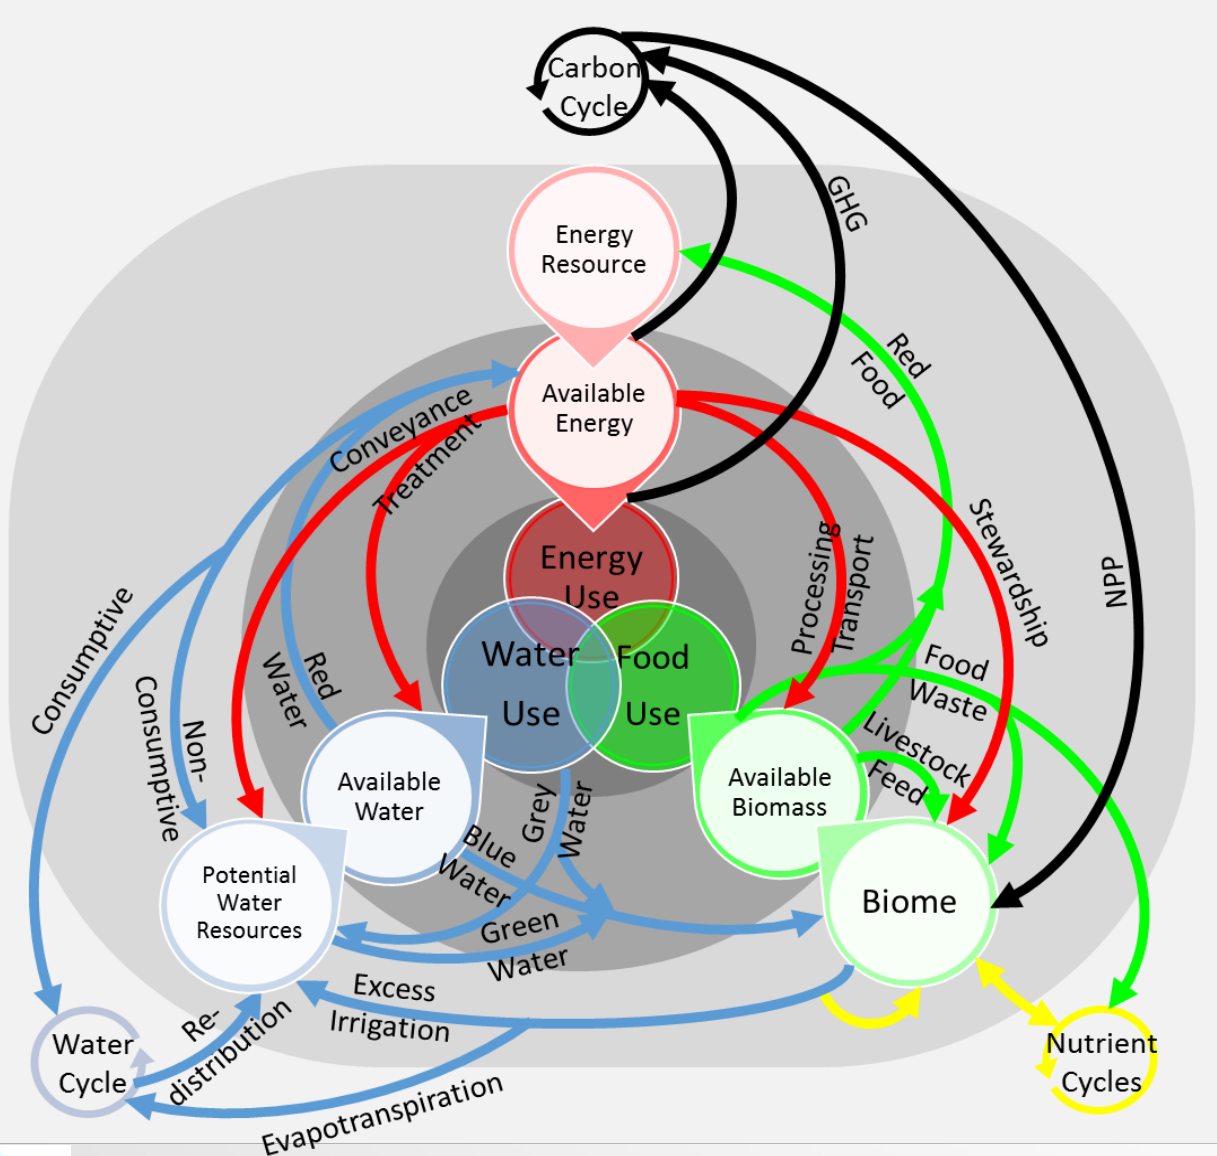

● 50.4 %  
● 37.9 %  
● 11.7 %

● Meteorological events

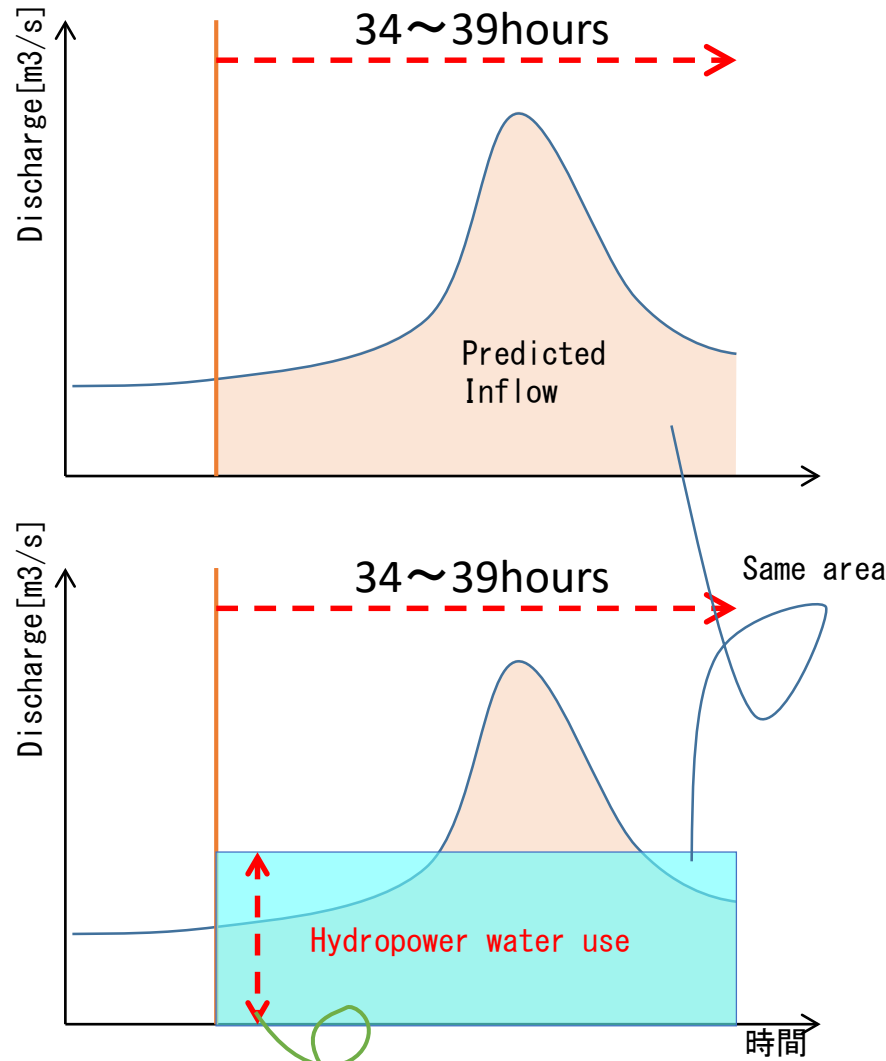

● Hydrological events

● Climatological events

# Water –Energy-Food Nexus

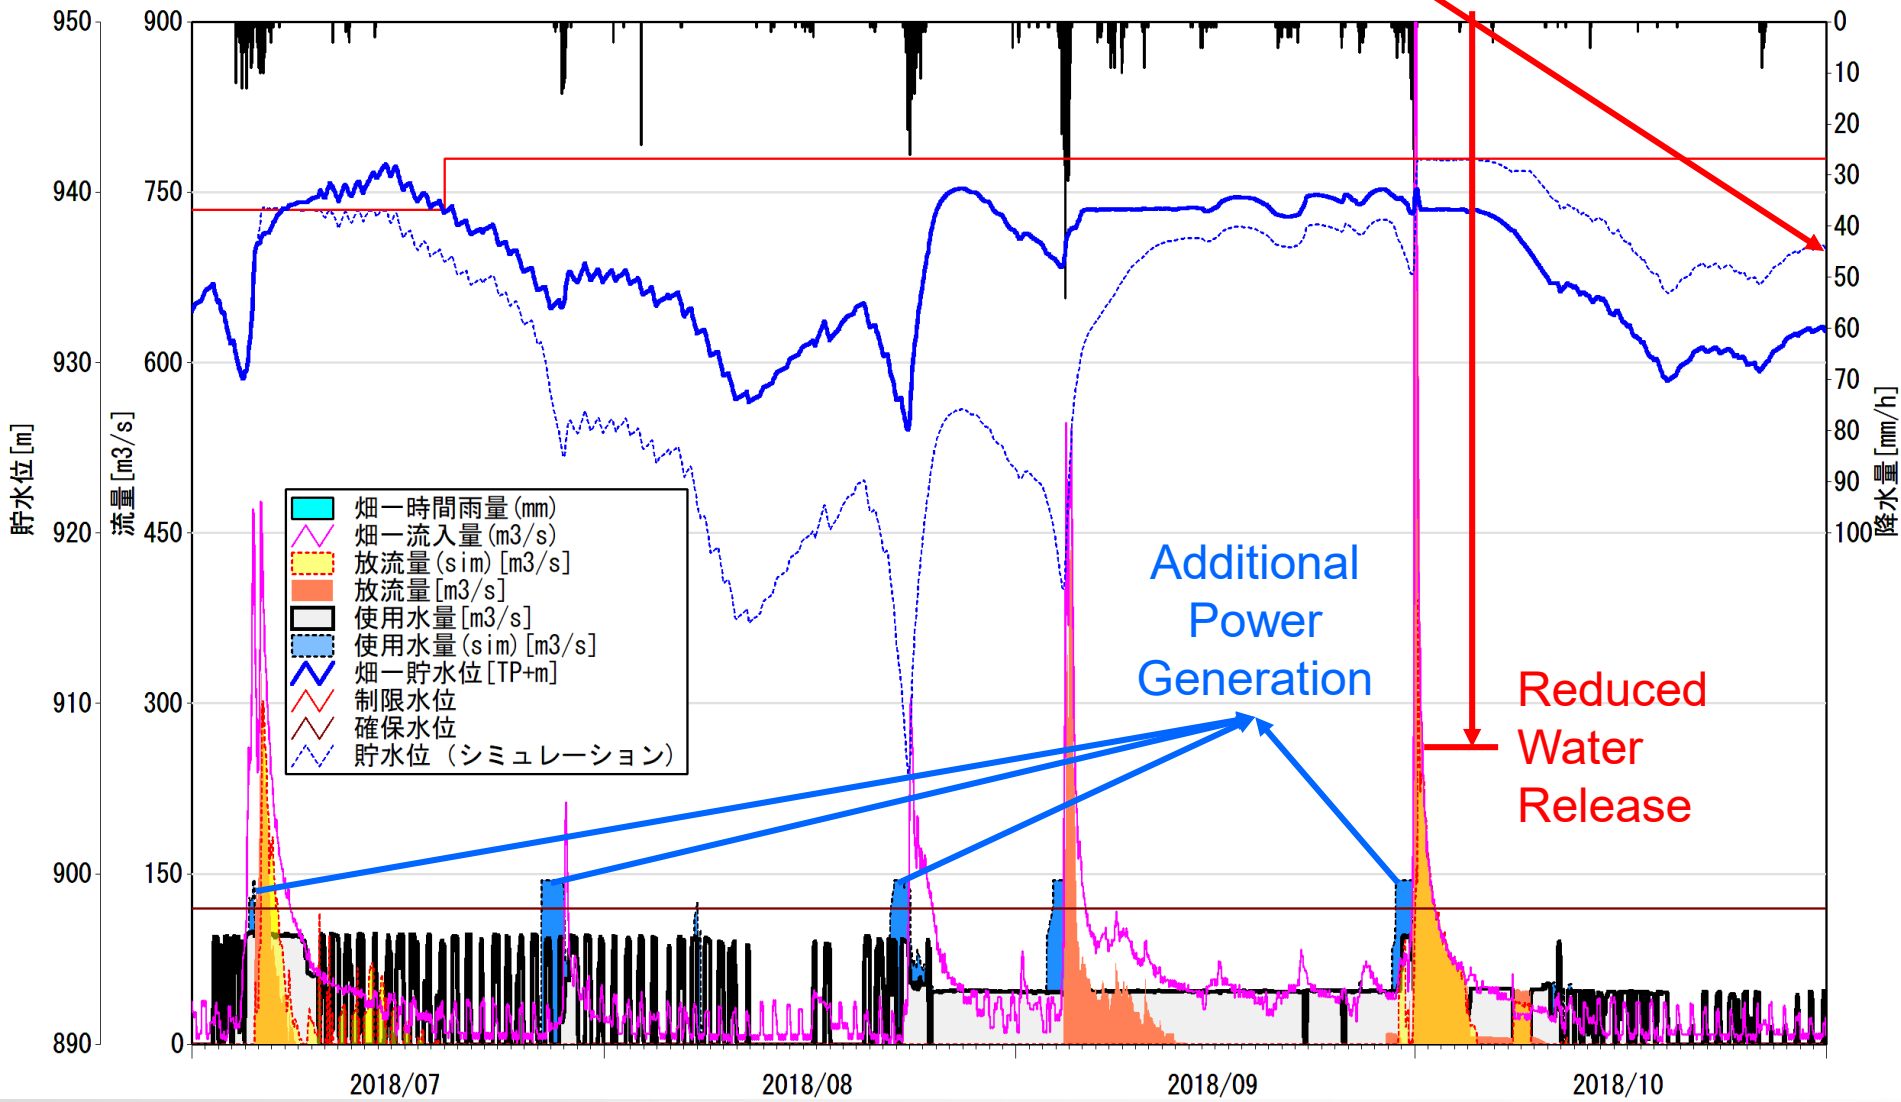

# Hydropower Operation Optimization based on Ensemble Inflow Prediction

less than the maximum power generation capacity

Increase of power generation by 16% Higher water level at the end of flood season

# Integrated Hydrological Modeling and Seasonal Prediction

United Nations  
Educational, Scientific and  
Cultural Organization

International Centre for  
Water Hazard and Risk Management  
under the auspices of UNESCO

*ICHARM: Delivering best available knowledge to local practices*

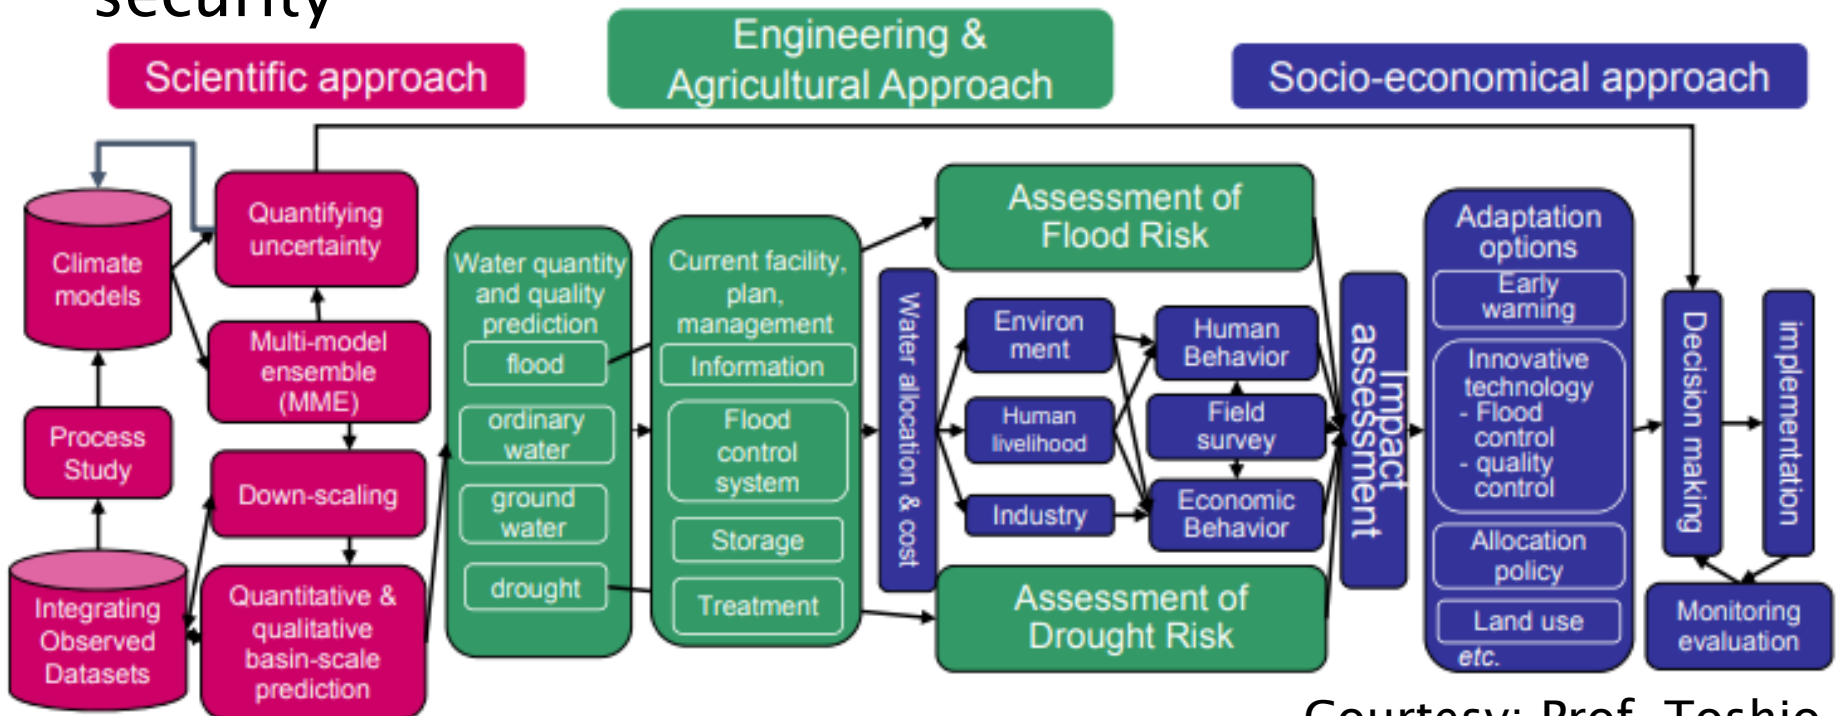

**WATER-AGRICULTURE-DROUGHTS JOINT SESSION - AOGEO-2019**

# *A Seamless Modeling Approach for effective Climate Change Adaptation planning*

*Dr. Mohamed Rasmy  
Senior Researcher,  
ICHARM/PWRI  
Associate Professor, GRIPS*

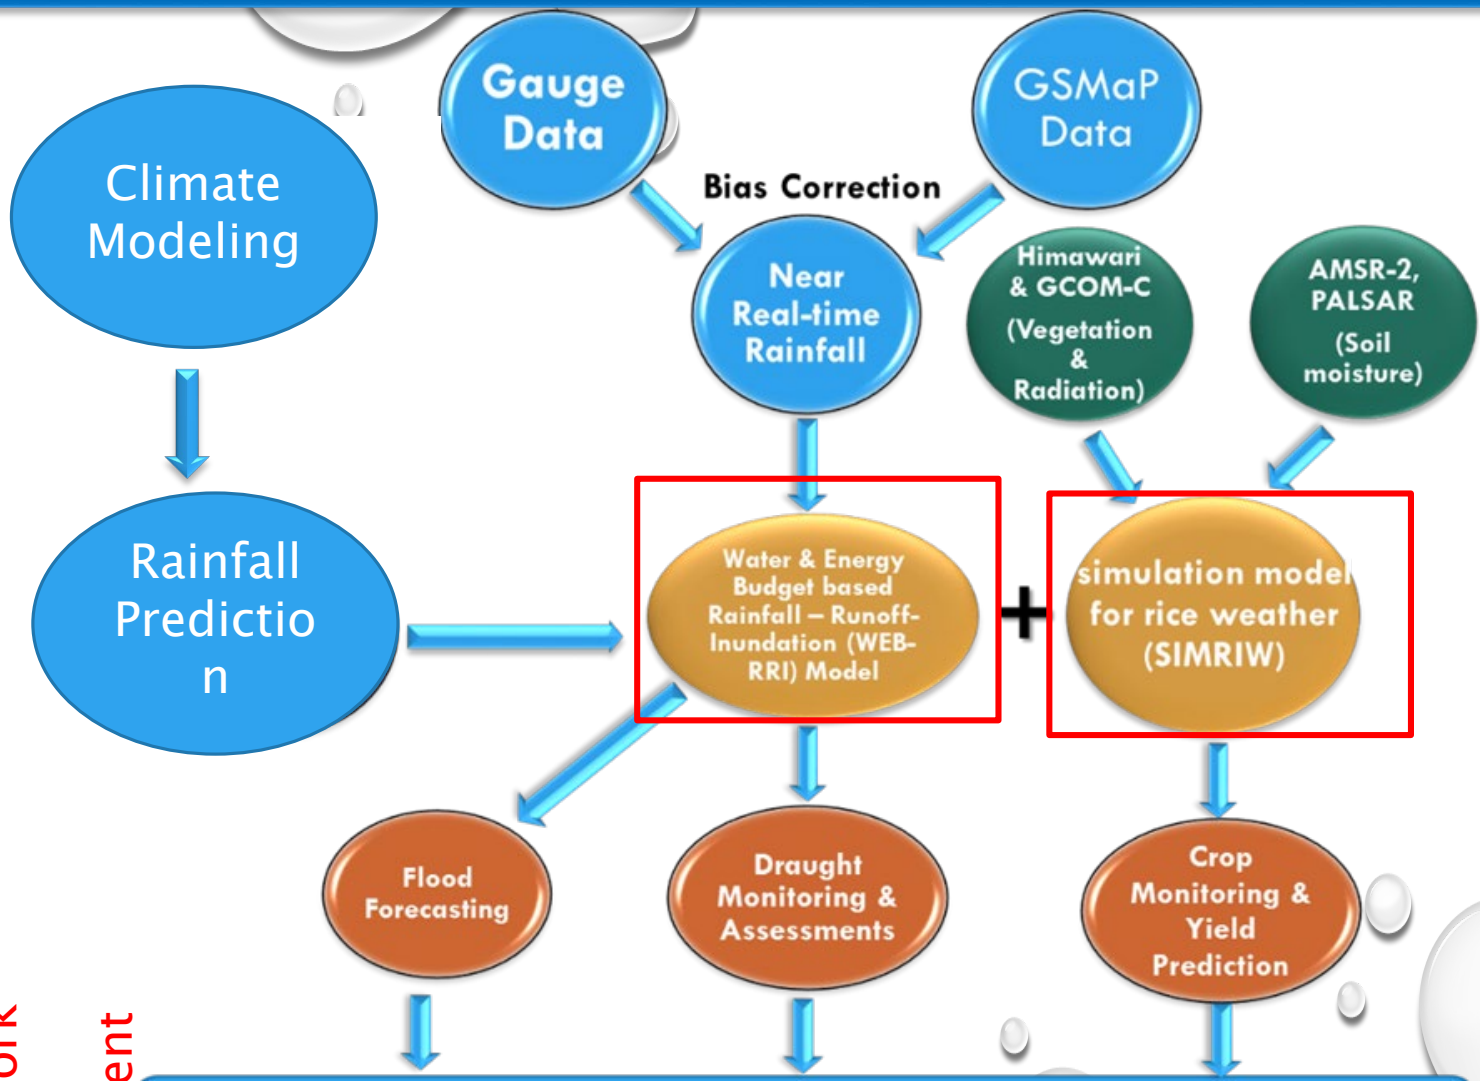

# Adaptation

- Climate change (CC) is a massive threat to sustainable development
- Reliable assessments of CC impacts very essential to draw efficient adaptation strategies for effective water resources management and thus ensuring food security

Courtesy: Prof. Toshio Koike

Climate modeling

Hydrological modeling

Crop Modeling

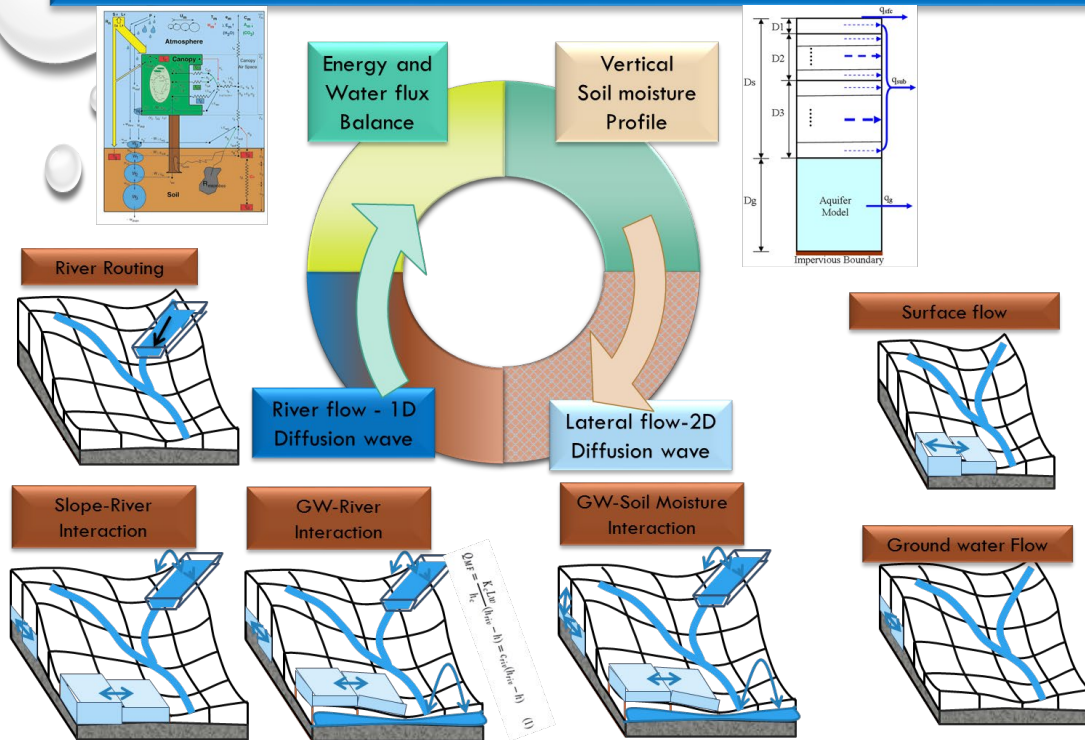

Economic Modeling

- Sendai Framework
- Paris agreement
- SDGs

**Socio-economic Benefits:**

- Hazard Maps & Disaster Early Warning, Assessment of Risk and Damages
- Review of Irrigation practices, Adaptability measures, and Impacts on Economy

# Approach

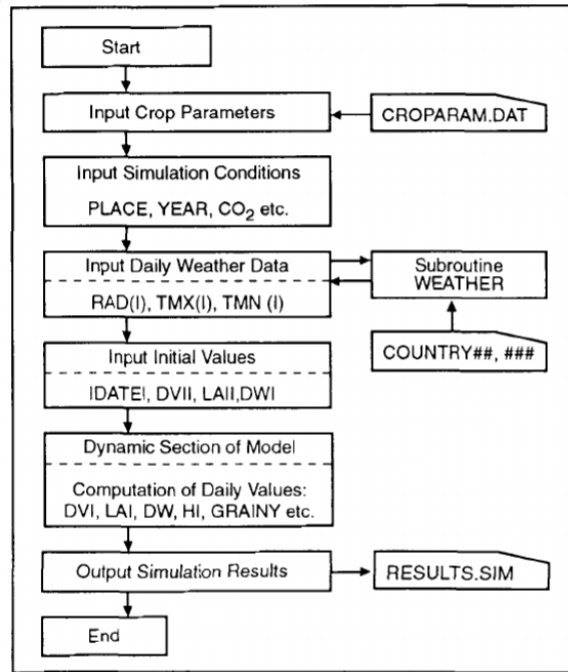

## Water and Energy budget Rainfall-Runoff-Inundation (WEB-RRI) Model

*Rasmy et al., 2019: Journal of Hydrology*

- ❑ Physical formulations for ET, and soil moisture → improve reliability of flood and drought
- ❑ Reliable responses to the water cycle variability as well as climate change scenarios → Assessment of hydrological extremes with a great confidence
- ❑ Complete consideration of hydrological cycle with restarting function → enable reliable real-time applications such as flood forecasting

# Rice & Eco-Hydro Modelings

4.7. Flow chart of the SIMRIW program.

**Simulation Model for Rice-Weather Relations (SIMRIW) model developed by Prof. Horie (1987)**

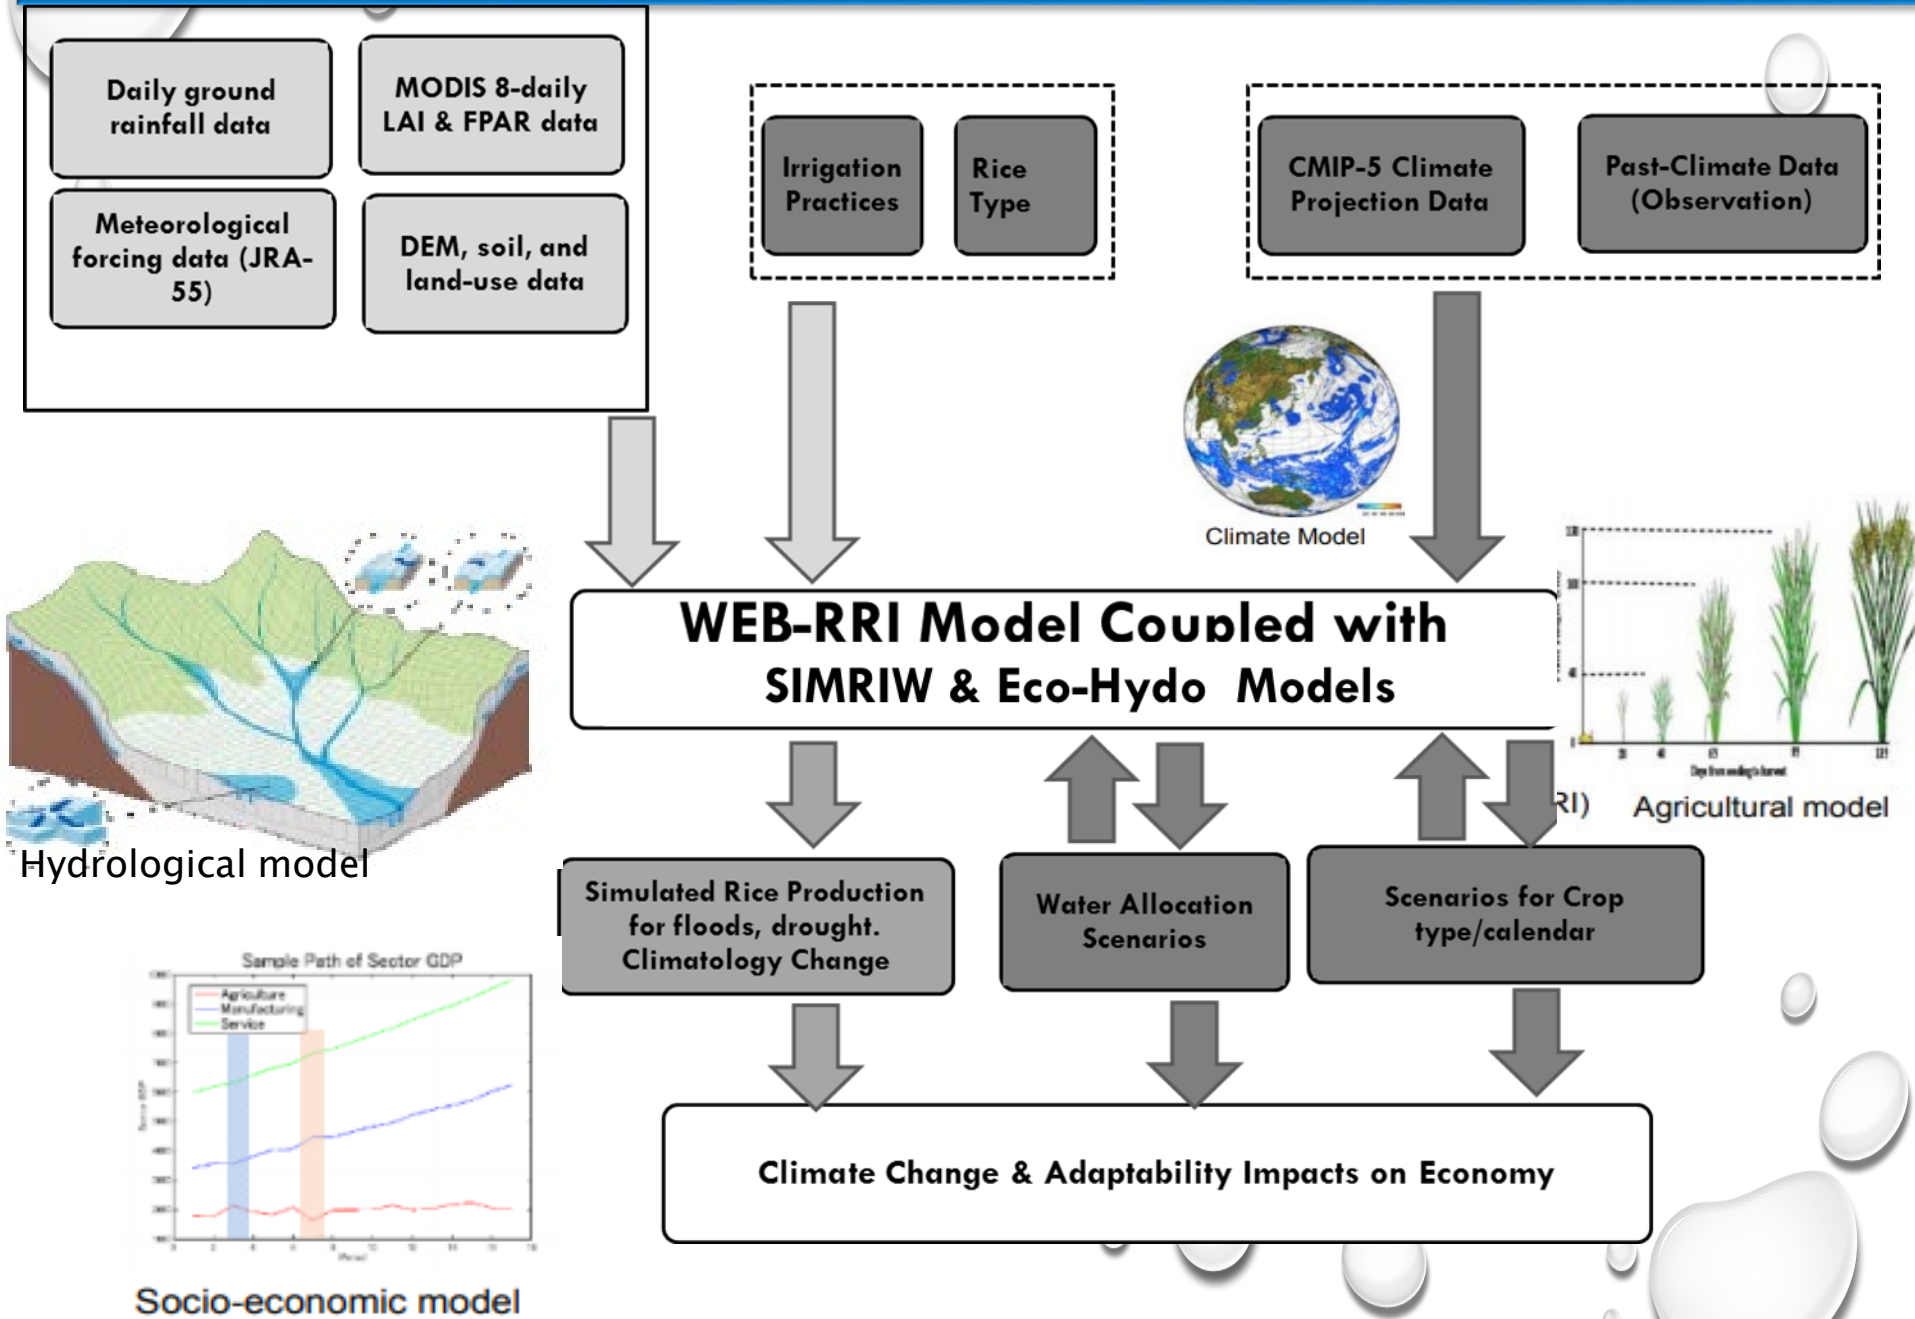

SIMRIW predicts the potential yield that can be expected from a given cultivar under a given climate

**Eco-hydrological Model with and vegetation dynamics by Sawada et al., 2014**

The model solve water-vegetation interactions and contribute to an understanding ecosystem responses to hydrological extremes.

# ONE MONTH LONG PREDICTION OF RAINFALL/TEMPERATURE IN TONE-RIVER BASIN

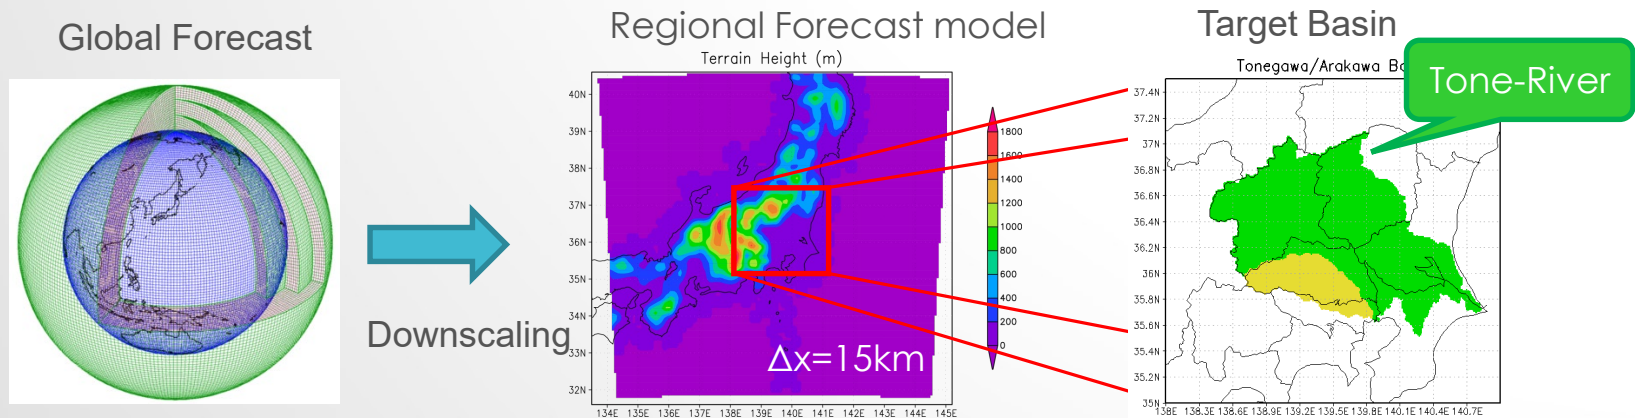

Tomoki Ushiyama  
Research Specialist

International Centre for Water Hazard and Risk Management (ICHARM)  
under the auspices of UNESCO, Public Works Research Institute (PWRI)

# ONE MONTH LONG PREDICTION OF RAINFALL IN TONE-RIVER BASIN

- For water resource risk management in Tokyo area, Tone River basin rainfall is quite important.
- We evaluated one month prediction of rainfall/temperature provided from Japan Meteorological Agency (JMA).
- We further downscaled the global forecasts into 15km resolution by using WRF model.

# ACCUMULATED RAINFALL

2019062500

2019070200

2019072300

# RMSE FOR ACCUMULATED RAINFALL

## RMSE Downscaling

## RMSE GCM

- Downscaled rainfall (left) is mostly better than GCM original (right).
- There are periods of bad accuracy (23, 24 July, 27, 28 Aug.)

# ENSEMBLE SPREAD FOR ACCUMULATED RAINFALL

## Spread Downscaling

## Spread GCM

- Ensemble spread is larger in downscaled rainfall (left) than GCM original (right). (Wider probability of uncertainties)
